

Kitchen Waste Composting With Worms

WHY WORMS?

Worms are the animal kingdom's master composters of kitchen waste, turning it into a rich high-quality compost for your garden. In King County, it's recommended that kitchen waste be buried and covered by at least 8" of soil, **or composted** in a worm bin. **Worms bins** are an efficient and fun way to recycle food wastes into compost that can improve your garden soil.

Worm Bins Choose a container

Use a sturdy box (either wooden or plastic) with a tight-fitting lid to keep pests out and moisture in. A shallow box about a foot deep is best as worms live near the surface in order to breathe. You need about one square foot of surface area for each pound of kitchen waste. For outdoor bins, drill holes in the bottom for drainage. For indoor bins, drill holes on the sides and be sure liquid doesn't accumulate in the bottom. To buy a ready-made worm bin, see resources on this sheet.

Add bedding

Shredded newspaper, corrugated cardboard, coarse sawdust or dry leaves make good bedding. Moisten first by soaking; then squeeze water out and fill the container to the top. Add more bedding when the contents seem too wet, or to cover food waste if fruit flies appear.

Add worms

Red wiggler worms thrive on organic materials such as kitchen waste. Don't use earthworms or nightcrawlers as they live in soil and don't eat kitchen waste. A starter batch of a pound or two can come from a friend's worm bin, or see resources on this sheet. Worms like to stay between **59°-77° F**

though they can handle temperatures between 33°-86° F. Shelter outdoor bins from hot sun and cold nights.

Add kitchen waste

Feed your worms vegetable and fruit remains, coffee and tea grounds and filters, moldy bread, grains and cereals. Cut scraps into small (one-inch) pieces for softer digestion and faster composting.

Don't feed them meat, dairy products, fats, oils, non-biodegradable materials or pet wastes. Within your bin, **rotate locations of food distribution**. Even distribution speeds up the composting process.

Harvest the compost

In a month or two, remove the finished castings and change the bedding. Too many castings can be toxic to the worms. Two ways to remove compost and leave the worms:

Push the crumbly castings (compost) to one side. Place new bedding in the empty side and add new food scraps. As the worms finish in the old side, they'll move to the fresh bedding side and you can remove the finished compost.

Pile the compost in the sun. Worms don't like the light and in a few minutes will move below the surface. Scrape off the top layer. Wait 5 – 10 minutes and repeat the process until you have a pile of mostly worms that can be returned to the worm bin to get back to work.
